Dissertation submitted to the Faculty of Information Technology, University of
Moratuwa, Sri Lanka for the partial fulfillment of the requirements of the Degree of
MSc in Artificial Intelligence

October 2012

Declaration

I declare that this dissertation does not incorporate, without acknowledgment, any material previously submitted for a Degree or a Diploma in any University and to the best of my knowledge and belief, it does not contain any material previously published or written by another person or myself except where due reference is made in the text. I also hereby give consent for my dissertation, if accepted, to be made available for photocopying and for interlibrary loans, and for the title and summary to be made available to outside organization.

Acknowledgements

I am heartily thankful to my supervisor, Prof. Asoka S. Karunananda, for his supervision, advice and guidance from the very early stage of this work till the last level as well as providing me encouragement & support in various ways which enabled me to develop an understanding of this subject.

I owe my deepest gratitude to Dr. Koliya Pulasinghe and Dr Malitha Wijesundara for their encouragement and support to have MSc opportunity at University of Moratuwa.

The invaluable guidance and support given me when I was in disarray and in need of some assistance by Nuwan Wijeweera and all the other MSc in AI batch mates is highly appreciated. I have learned so much from them.

Life would have been much harder and tougher if there were not my colleagues Sujith Fernando, Nilmini Wijegunasekara, Asanka Pathirana, Lasitha Niwanka and Sachini Weerawardhana. Their unlimited support on fulfillment of this work is remembered with much gratitude and special thank goes to Renuka Pathirana for language editing of this thesis.

I also express my sincere thanks to my friends Pubudu Nuwanthika, Janaka Wijekoon and Saneth Dharmakeerthi for their encouragement to complete this work and provision of useful resources to success the work.

I am grateful to all my lecturers and teachers for sharing their invaluable knowledge, experience and providing advises to improve the quality of my life.

And of course, I need to thank my parents. Their unconditional love and support have helped me through some very difficult times. I did my best to give them a reason to be proud.

Lastly, I offer my regards and blessings to all of those who supported me in any respect during the completion of the project.

Abstract

Most of the real world problems can be solved using more than one method which may return slightly different solutions. For instance, a number of methods including statistical methods, artificial neural networks, fuzzy logic and genetic algorithm can be used to model many real world problems such as weather forecasting. Yet these methodologies in isolation may have a common issue of considerably high false positive rate. However, it is evident that human beings can modify/improve solutions generated in the individual capacity through negotiations among them. This concept has been employed in the Multi Agent Systems (MAS) technology which can model complex real world problems to achieve quality solutions beyond the individual capacity.

In this project, MAS has been used to ensemble weather forecasting results individually generated by Artificial Neural Network (ANN) and Genetic Algorithms (GA) through negotiation among solutions. It considers ANN and GA as two agents. It has selected this application domain to demonstrate the concept since weather forecasting is important for many sectors such as agriculture, fisheries and transportation. A reliable weather forecast report is of great importance for those sectors to plan their activities by mitigating difficulties they face from bad weather conditions. Many countries have also used ANN and GA for the weather forecasting domain. Our MAS solution forecasts the rainfall for next twenty four hours with the use of Maximum temperature, Minimum temperature, Relative humidity day time, relative humidity night time and Rainfall as inputs for ANN and GA agents. The defined two agents are used to operate on an Artificial Neural Network and Genetic Algorithm solutions that start negotiation & deliberation to produce a more rational forecasting. Historical weather data based on the Colombo city area was used to train the Artificial Neural Networks and genetic algorithm based forecasting models. The trained dataset includes two months of daily basis temperature, relative humidity and rainfall data. In order to evaluate the solution part of the historical weather data set has been used as the test data. The experiment concludes that even when solutions by ANN agent and GA agent shows a disparity at the beginning, they reach to commonly agreeable solution through the negotiation in the multi agent solution with a 65% of overall success.
