DECLARATION OF THE CANDIDATE

“I declare that this is my own work and this thesis/dissertation does not incorporate without acknowledgement any material previously submitted for a Degree or Diploma in any University or other institute of higher learning and to the best of my knowledge and belief it does not contain any material previously published or written by another person except where the acknowledgement is made in the text”

Signature:

Date:

DEDICATION

This thesis is dedicated to my beloved parents and my loving husband who never failed to aid me with the financial and moral support when required instilling the importance of hard work and higher studies and teaching me that the best kind of knowledge to have is that which is learned for its own sake.

ACKNOWLEDGEMENTS

It would not have been a successful upshot if the absence is there of the healthy guidance and some of caring individuals who genuinely added their valuable support even by a word till seen the finishing point of this research.

Firstly the utmost gratitude would be offered to Dr. T.S.G. Peiris, the coordinator of MSc / PG Diploma in Operational Research, Department of Mathematics, Faculty of Engineering, University of Moratuwa facilitating us in every possible ways to continue the research.

For the unselfish and unfailing guidance with the sincerity and steadfast encouragement I should highly admire Mr. M.M.D.R. Deegahawature, the department of Industrial Management, Faculty of Applied Sciences, Wayamba University of Sri Lanka, being my supervisor. The greater dedication of him on carrying out this much of successful wrapping up is really unforgettable.

There would not be a continuation of this research further unless the morale support of my university batchmate  Mr. Naveen Atapattu who provided me required information and shared valuable insights in the relevance of the study despite of his valuable time and official duty.

It is my duty to offer the gratefulness to Dr. K.D.D.N. Dissanayake, the Head of department of Industrial Management, Faculty of Applied Sciences, Wayamba University of Sri Lanka for encouraging me and giving an infrequent opportunity to present the proposal of this research in front of a panel of senior research fellows at Wayamba University Research Symposium in order to enrich my research objectives and methodologies through further well experienced supervision.

The support of academic staff of the department of Industrial Management, Faculty of Applied Sciences, Wayamba University of Sri Lanka would awake my mind here by sharing their research experience and productive ideas to carry my objectives fruitful.

Last but not the least, I must pay my thousands gratitude to my family and beloved husband, for giving me the strength in hurdling all the obstacles in the completion of this research work.

ABSTRACT

The performance greatly affects the survival and prolonger life time of the manufacturing industry of Sri Lanka. In measuring the corresponding level of performance, the term “productivity” becomes vital. It entails updating the productivity improvement techniques in accordance with the technological advancements of the industry. Manufacturing Excellence programme has become the most updated version of productivity improvement technique. It enhances all the processes, people, goods and information within the work floor providing a good performance in achieving of a higher level of productivity. Since maintenance also has a strategic dimension, its performance measurement system should be linked to the espoused strategy of the function in order to get the maximum impact. It has been clearly recognized the presence of failures in former attempts of implementing productivity techniques due to the unidentified proper maintenance function. This research therefore attempts to develop a suitable maintenance function which describes the relationship between the performance of productivity improvement and different indicators of maintenance practices. Based on this conceptual framework built on successful review of literature related to the area concerned, it was decided to include six performance indicators of the maintenance process into the model. The required data to develop the model was acquired through a structured questionnaire. The model identified that the two significant performance indicators that influence the performance of productivity improvement technique are the extent of training and equipment failure responsiveness. The model was developed through step-wise regression procedure and it was confirmed by both forward selection and backward elimination procedure. As model was developed based on information from one organization it is suggested to develop similar models for other organizations as well.

KEY WORDS: Productivity Improvement, Manufacturing Excellence Programme, Maintenance Function, Maintenance Practices.

TABLE OF CONTENT

| | Page No. |
