ABSTRACT

In robot manipulator trajectory planning, jerk controlled trajectories are desirable for their amenability in path tracking, vibration suppression and reducing of manipulator wear. Bounded and continuous jerk trajectories narrows the jerk profile within known limits, eliminating discontinuities and spontaneous rising of jerk, which are otherwise undesired. In this research, a new method for generating a bounded and continuous jerk trajectory in joint space is implemented and tested. Spline functions are a common method for interpolating a set of via points for generating robot manipulator trajectories. The method introduced in this research is a novel and robust spline interpolation algorithm, interpolating a 5th order, 3rd order and 5th order piecewise polynomial (5-3-5 spline), which can generate point-to-point trajectories as well as trajectories with via points. Generated trajectory has continuously differentiable profiles for position, velocity and acceleration and has a start and end zero-bounded, continuous jerk profile. The algorithm allows the user to independently define the position, velocity, acceleration and jerk values at both start and end points. At via points, the continuity up to 5th time derivative is maintained, and the user can define via point position and velocity. Also it allows the user to define interpolation time intervals between every polynomial segment. Along with the bounded and continuous jerk profile, these adjustable parameters in the 5-3-5 spline algorithm results an effective and robust trajectory generating method. Trajectories generated using the 5-3-5 spline algorithm was simulated and tested successfully on DENSO VP6 robot arm. The experiments demonstrated and proved the robustness and applicability of the new trajectory generating method in both point-to-point and via point motions

Key words: Joint space trajectory planning, controlled jerk, continuous acceleration, piecewise polynomials, 5-3-5 spline trajectory, point-to-point motion, motion with via points

ACKNOWLEDGEMENT

I make this opportunity to express my sincere gratitude to Prof. Rohan Munasinghe, for supervising this project with his winning guidance and encouragement, and cooperation throughout the entire work, and also for offering me the opportunity of experimenting with the DENSO robotic manipulator.

I am thankful to the academic staff of the Department of Electronic and Telecommunication Engineering of University of Moratuwa for their dedication and support provided for this MSc research.

Furthermore, I am thankful to everyone who supported me in many ways contributing to the success of this project

Last but not least, I am thankful to my family for encouraging me and for standing by me throughout this project
