DECLARATION

Declaration of the candidate

“I declare that this is my own work and this thesis does not incorporate without acknowledgement any material previously submitted for a Degree or Diploma in any other University or institute of higher learning and to the best of my knowledge and belief it does not contain any material previously published or written by another person except where the acknowledgement is made in the text”.

Also, I hereby grant to University of Moratuwa the non-exclusive right to reproduce and distribute my thesis, in whole or in part in print, electronic or other medium. I retain the right to use this content in whole or part in future works (such as articles or books).

Sizing of Reinforced Concrete Structural Members Based on Sri Lankan Design Data

Abstract

The majority of building structures in Sri Lanka, are of reinforced concrete. Often it is required to estimate structural member sizes at the initial stage of a building construction project for load evaluation, cost estimation and reinforcement design.

For member dimension estimation, theoretical knowledge alone is inadequate as there are some practical issues also to be addressed. This study proposes reinforced concrete member sizes for future projects based on design data of past low to medium rise buildings in Sri Lanka.

Standards available for member size estimation, difficulties encountered by the designers while following available standards, gaps in existing sources, and applicability to local conditions are discussed. Structural and architectural drawings of twenty one buildings from two to thirteen storeys were used to extract design details related to slabs, staircases, beams, columns and footings elements. Data gathered for each element type are used to interpret relationships between member dimensions and design parameters.

Artificial Neural Networks (ANN) is an artificial intelligence technique for recognizing patterns among data that are difficult to represent algorithmically. This study also explores the potential of using Sri Lankan design data from past buildings in Artificial Neural Network models for predicting reinforced concrete member sizes.

Recommended structural member sizes are presented in graphs and tables, and compared with the ANN model results. Finally the member sizes recommended by the study are compared with the sizes derived according to the available literature.

Key Words: Low to medium rise Buildings, Reinforced Concrete, Structural Member sizes, Artificial Neural Networks

ACKNOWLEDGEMENT

First of all I would like to express gratitude to my supervisor Prof. W.P.S. Dias for introducing me to this topic and giving earnest support by reviewing and commenting on the work throughout the study. I would also like to thank staff of the Department of Civil Engineering at University of Moratuwa for their support and guidance.

I'm indebted to my employer, Central Engineering Consultancy Bureau (CECB), for allowing me to use the structural and architectural drawings of buildings for the research. I would like to thank Drawing Officer, (Ms) Malkanthi Rajapaksha and draughtsman staff of CECB for helping me to find drawings of buildings which were prepared several years ago. I'm also thankful to my colleagues and staff for helping me to find necessary information and encouraging me throughout.

I also would like to thank my family, who has supported and encouraged me throughout the entire process.

LIST OF ABBREVIATIONS

Abbreviation	Description
A	Tributary Area
ANN	Artificial Neural Network
b	Beam or column width
D	Depth of footing
f_{cu}	Compressive strength of concrete
h	Slab thickness / beam depth or column depth
L	Length of footing
l	Span
l_x	Shorter Span
l_y	Longer Span
l_x/l_y	Ratio of spans
MAE	Mean absolute error
MR	Multiple regression
RSTD	Standard deviation of ratios
$ 1 - RAVG $	Deviation of average ratio from unity
