Declaration

I declare that this thesis is my own work and has not been submitted in any form for another degree or diploma at any university or other institution of tertiary education. Information derived from the published or unpublished work of others has been acknowledged in the text and a list of references is given.

Acknowledgements

Foremost, I would like to express my sincere gratitude to my supervisor Mr. Chaman Wijesiriwardana, for the continuous support of my MSc study and research, for his patience, motivation, enthusiasm, and immense knowledge. I have been amazingly fortunate to have a supervisor who gave me the freedom to explore on my own and at the same time the guidance to recover when my steps faltered. Besides my supervisor, I would also like to thank my family for the support they provided me through my entire life and in particular, I must acknowledge my father and mother for the encouragement and guidance throughout my MSc.

Abstract

Carpooling is considered as a solution to address the current problems in travelling, in a context of high fuel cost, vehicular traffic congestion, which leads to air pollution, health hazard, vehicle parking problems and wasting of valuable time resulted in high opportunity cost. Carpooling is the process of utilizing a pool of passengers into matching vehicles, when there are freely available vacant seats in passenger vehicles, which could be made use of by needy passengers, minimizing the per head cost of travelling in a macroeconomic sense. The matching of drivers and passengers by maintaining a set of data, can be implemented by developing information and communication technology based applications. The drivers can post the availability of the vehicles and the number of vacant seats in their vehicles in this application and the passengers can search and contact the relevant drivers on a preferred route. By matching these needs of two parties through the proposed system, it is expected to address the above mentioned issues with a satisfactory contribution towards the optimization process of cost of travelling in a macroeconomic context. There are many carpooling systems in application in different countries and also many research and development works were done in this field to improve the quality of the carpooling systems. However, developing a system to assist the passengers as well as the drivers, searching a best and ideal route(s) to reach their destinations, with their preferred parameters is a complex and challenging task.

This research presents an improved searching method, which makes sure that the resulting routes are most suitable and identical routes, considering the route information entered by the passenger. This system will also generate and suggest alternative routes to the driver, after analyzing the lift request data entered by the passengers, for his consideration and then him to decide on the preferred route.

Table of Contents

Chapter 1	1
Introduction.....	1
1.1. Prolegomena	1
1.2. Proposed searching and suggesting method.....	3
1.3. Summary	4
Chapter 2.....	5
Developments in route searching solutions	5
2.1. Introduction.....	5
2.2. Similar models	5
2.3. Summary	17
Chapter 3.....	19
Technology adopted – Route searching and suggesting	19
3.1. Introduction.....	19
3.2. PHP scripting language.....	19
3.3. MySQL database management tool	19
3.4. Apache web server	20
3.5. WAMP server	20
3.6. Google Maps JavaScript API.....	20
3.7. Route Boxer utility library	20
3.8. JQuery JavaScript library.....	20
3.9. Summary	20
Chapter 4.....	21
Route searching and suggesting approach	21
4.1. Introduction.....	21
4.2. Route searching approach.....	21
4.3. Alternate route suggesting approach.....	23
4.4. Summary	24
Chapter 5.....	25
Analysis and design	25
5.1. Introduction.....	25

5.2.	Route searching front-end	25
5.3.	Lift offering front-end	26
5.4.	Route searching module	26
5.5.	Route suggesting module	26
5.6.	Spatial database manager	26
5.7.	Summary	27
Chapter 6	28
Implementation	28
6.1.	Introduction	28
6.2.	Route searching front-end	28
6.3.	Lift offering front-end	30
6.4.	Route searching module	31
6.5.	Route suggesting module	32
6.6.	Spatial database manager module	38
6.7.	Summary	38
Chapter 7	39
Evaluation	39
7.1.	Introduction	39
7.2.	Verifying the distance	39
Chapter 8	41
Conclusion and Further work	41
