July 2019

DECLARATION

I declare that this is my own work and this thesis does not incorporate without acknowledgement any material previously submitted for a Degree or Diploma in any other University or Institute of higher learning and to the best of my knowledge and belief it does not contain any material previously published or written by another person except where the acknowledgement is made in the text.

I hereby grant to The University of Moratuwa the irrevocable, non-exclusive, and royalty free license to archive and make accessible my work in whole or in part in all forms of media, now or hereafter known. I agree that the document mentioned above may be made available immediately for worldwide access unless an embargo applies.

I retain all other ownership rights to the copyright of my work. I also retain the right to use in future works (such as articles or books) all or part of my work. I understand that I am free to register the copyright to my work.

ACKNOWLEDGEMENT

First and foremost, I would like to thank my supervisor Dr. D.A.S. Amarasinghe, Senior lecturer of the department of materials science and engineering, University of Moratuwa. Starting from the conceptualization of the research to the very end, he had guided me and shaped me to be a good researcher by his eternal optimism and the vast scientific knowledge. He corrected me when I took things too lightly and mentored me not to fall down in hard times throughout this research. Finally, thank you for believing in me and the tremendous support you have given.

My deepest gratitude goes to my second supervisor Dr. Dinesh Attygalle, whose scientific skills and uncompromising quest for excellence are admirable. Without his common-sense, knowledge, perceptiveness and cracking-of-the-whip I would never have finished. Thank you for all the scientific and non-scientific discussions and the guidance given me throughout this time.

Special gratitude goes to Mr. V.S.C. Weragoda, my third supervisor and then, Head of department at materials science and engineering, University of Moratuwa. With all the busy schedules, he had enough time for my research activities. His support was not limited only for the quality of the research but also provided the administrative support throughout the research, including the funding of the research through a research grant. Thank you.

Further, university senate research committee for the financial aid given by grant, SRC/LT/2018/05 is greatly acknowledged.

Furthermore, I would like to thank the research committee, Prof. Sudath Kalingamudali and the former research coordinator and the current head of department Mr. V.Sivahar for reviewing the progress of the research as well for the support given. Also, I greatly appreciate the assistance that I received from all the academic and non-academic staff of Department of Materials Science and Engineering, University of Moratuwa.

I dedicate this thesis to my mother and father whose love and guidance made me the person I am today. Throughout my life you were there by my side loving, caring,

punishing and teaching everything. I know you have sacrificed a lot when shaping my future. You are the best parents ever. I am forever in debt. Thank you for everything.

I owe an enormous debt of gratitude to my loving wife Tharaka Perera for the support given. As an electronics and telecommunication engineer, her intuition and the knowledge always uplifted my research work. Her contribution to this research is highly acknowledged. Not only in research aspects, but also as my life partner she was there for all the up and downs in my life. Her love and care always made me special and it helped me to hold on to the achievements in research as well as in life without falling apart at time of difficulty. Throughout this journey, you have sacrificed a lot and thank you for everything.

My sincere gratitude should go to my mother-in-law and father-in-law for the support given during this time, especially for hosting me and my wife. You made the best academic environment for me to continue my research work at home. Thank you for all the support given.

Not to forget my brother and sister who were there in every milestone of my life. Although I was always the stubborn brother, you never let me down. You are the hidden strength of my life. Thank you for helping me to be a better person.

Last, but not least, I want to thank my loving friends, Darshi Egodage, Thisara Sandaruwan, Madhawa Kumarasingha and Uthpala Dilrukshi for their endless support and encouragement throughout this duration.

I would like to thank everybody who was important to the successful realization of this thesis, as well as expressing my apology that I could not mention personally one by one.

Roshan Dodampola

ABSTRACT

Thermogravimetric (TG) analysis and differential thermogravimetric (DTG) analysis are the most commonly used analytical techniques to determine the kinetic behaviour of solid-state chemical reactions through Arrhenius parameters and reaction model, which is called the kinetic triplet of solid-state reactions. There are number of methods proposed in the literature for extracting the kinetic parameters of solid-state reactions from TG & DTG thermograms. However, thermal event separation using curve fitting where overlapped thermal events may be present is mandatory before further TG/DTG analysis. In this study, a better curve fitting procedure and a new model fitting method for kinetic parameter extraction is proposed. Enhanced accuracy of the proposed method is proved by MATLAB® based, simulated DTG signals. Furthermore, a mathematical approach using higher differentials of DTG signal was developed to count the number of thermal events in overlapped DTG peaks.
