Abstract

In this research, a new approach to develop an object pushing system with a simple mobile robot with two DC servo motor driven wheels and two castor wheels are introduced. This is an attempt to design and develop a system with less number of sensors to detect the reaction force generated on the mobile robot while pushing an object. The robot behavior is such that it always tends to push the object towards the center of the pusher attached to the robot. This is achieved by rotating one driving wheel of the robot by a fixed amount of rotation. This rotation is such that the motor torque is increased continuously by increasing the motor driving positive pulse width of the pulse width modulated signal from its neutral position until the required amount or rotation is obtained. At this moment the motor stops and the wheel attached to the other motor follows the same operation. This motion creates a zigzag movement on the pushing plate attached in front of the robot. This zigzag motion always moves the object towards the centre of the pusher. When the object comes close to the centre of the pusher the force applied from both motors becomes equal. Detection of this force is done by using the positive pulse width of the motor and the encoder pulses generated by the optical encoder attached to both wheels of the robot. The test results are given to support the proposed approach.

DECLARATION

The work submitted in this dissertation is the result of my own investigation, except where otherwise stated.

It has not already been accepted for any degree, and is also not being concurrently submitted for any other degree.

Acknowledgement

I would like to express my sincere gratitude to my thesis supervisor Prof. Lanka Udawatta and the co supervisor Dr Harsha Abeykoon for the ingenious commitment, encouragement and highly valuable advice provided to me. Their rigorous attitudes to do the research and inspire thinking to solve problems are invaluable for my professional career.

I would also wish to express my indebtedness to the Arthur C Clarke Institute for Modern Technologies (ACCIMT) for providing me the necessary lab facilities for this research. I wish to thank Mr. Saraj Gunasekara, Head of the Space Applications Division, Mr. Shiran Welikala, Industrial Manager and other colleagues of ACCIMT who helped me in different stages of the project.

Special thanks go to Prof.Nihal Kularatna, senior lecturer of University of Waikato who always encourages me to progress my research work while giving me the necessary advices.

My thanks also go to my beloved mother Karunawathie Silva and late father Wilton Fenando, who bless and encourage me all the time.

My deepest gratitude is also extended towards my family and of course to my beloved wife Chamarie, for her consistent love, support, understanding, encouragement, and for the life we experience together, both in our good times and hard times. Without your support this would never have happened!

Last but not the least: I would like to thank all the staff members of the Department of Electrical Engineering of University of Moratuwa for their great contribution in conducting post graduate course in “Industrial Automation”.
