DECLARATION OF THE CANDIDATE

“I declare that this is my own work and this thesis/dissertation² does not incorporate without acknowledgement any material previously submitted for a Degree or Diploma in any other University or institute of higher learning and to the best of my knowledge and belief it does not contain any material previously published or written by another person except where the acknowledgement is made in the text.

Also, I hereby grant to University of Moratuwa the non-exclusive right to reproduce and distribute my thesis/dissertation, in whole or in part in print, electronic or other medium. I retain the right to use this content in whole or part in future works (such as articles or books).”

.....

Signature of Candidate
(T. T. Weerawardhana)

.....

Date

The above candidate has carried out research for the Masters dissertation under my supervision.

Senior Prof. T. S. G. Peiris
Senior Professor in Applied Statistics,
Department of Mathematics
Faculty of Engineering
University of Moratuwa

ABSTRACT

In the modern trends of industrialization and development, energy has become one of the most important aspects of every economy in the world. Among the energy sources that are available today, diesel has a considerable consumption for various activities such as production of goods and transportation in many countries including Sri Lanka. Using monthly data of ten explanatory variables (January 1998 to July 2018) vector error correction model of order 2: VECM (2) was developed to model monthly consumption of diesel in Sri Lanka. The diesel consumption has been increasing due to various activities. The most significant influential variables are Exchange rates of USD to LKR, Merchandize Imports, Number of Tourists Arrivals, National Consumer Price Index, and Electricity Power Generated. The errors of the model were found to be white noise. The percentage errors of the fitted data using the VECM (2) model for both trained and validated set vary from -8.4 to +8.5%. Further it was found that Exchange rates of USD to LKR, Merchandize Imports, and Number of Tourists Arrivals show significant long run positive association with diesel consumption while National Consumer Price Index and Electricity Power Generated indicate significant long run negative relationship with diesel consumption in Sri Lanka. This model is suitable only short term prediction and it is recommended to develop the model so that it can be used for long run prediction. Nevertheless, the model provides the analyst with the ability to make decisions using various predicted intervals with different membership values by controlling the explanatory variables.

Keywords: Vector Error Correction Model, Multivariate Time Series, Correlation, Consumption of Diesel,

ACKNOWLEDGEMENT

The author wishes to extend his sincere gratitude to the following people, for their generous support guidance, views and comments, which paved the way to the successful completion of this project:

Senior Prof. T.S.G. Peiris, Senior Professor in Applied Statistics and former Head of Department of Mathematics, Faculty of Engineering, University of Moratuwa and the Course Coordinator of M. Sc. / Post Graduate Diploma in Business Statistics, for being a visionary throughout the lifetime of this research project. His valuable insights and continuous comments helped me to complete this project successfully.

To the academic and non-academic staff at the Department of Mathematics for the all wishes and good will.

To my family and loved ones whom have offered their fullest support and strength of mind throughout my academic life.
