ABSTRACT

When looking at the simulation of the stock price, the Geometric Brownian motion model is a widely used share price prediction model in various countries. But, in the Sri Lankan context, the use of the Geometric Brownian Motion model in stock price prediction is not observable. As a filling of the gap and identifying the validity of the Geometric model in Sri Lanka were the main purposes of conducting this research

To obtain the validity of the GBM model was checked by using two hundred and fifty (250) companies in the Colombo Stock Exchange, which analyzed was forecasted from 2014 to 2018. The accuracy was verified by using the Mean Absolute Percentage Error (MAPE) value. A number of scholars used the MAPE-based judgment method to evaluate the accuracy of the forecast resulted from GBM. Since the MAPE values are between 0% and 10%, it implies that the GBM model is a highly accurate model for forecasting stock prices on the Colombo Stock Exchange in Sri Lanka. The forecast was limited only for one day. The mean value of the MAPE of the sample of 250 companies is 4.49 %. Further, 97.2% of the sample, the MAPE value was below 10%. It implies that a one-day price forecast is highly accurate in the Sri Lankan context.

Geometric Brownian motion model has been developed in the study to predict stock price behaviour, and the model has subsequently been used to exchange. The results of the simulated or forecasted prices were subsequently compared to the actual prices obtained. The results show that the model consistently predicts stock behaviour in more than 95% of the cases. A procedure to mathematically examine the probabilistic distribution of stocks has also been provided. It is expected that this scholarly work will help investors and other stakeholders, especially on the stock market in Colombo, to make informed decisions on trading and valuation. However, in this study, the forecast is limited only for one day. In other words, utilizing historical data until trading day t , someone can forecast the price of the trading day $t+1$.

Key Words: *Geometric Brownian Motion, Share Price Prediction, Colombo Stock Exchange*

DEDICATION

To my parents and my Supervisor, Mr Rohana Dissanayake

ACKNOWLEDGEMENT

A project such as this thesis can only be completed with an immense effort. The assistance of many was particularly helpful in the development of this thesis. I would like to express my gratitude for those whose support was essential to the completion of the thesis.

*First, I would like to express my gratitude to **Mr Rohana Dissanayake**, my supervisor, and the coordinator of the degree programme. He provided me with timely guidance and advice to generate this thesis, edit various drafts of my thesis, and gave valuable suggestions. He not only provided guidance from his knowledge and experience in the field of financial mathematics to my study but also provided emotional support during times of personal trauma. He continually motivated me to persevere with the thesis.*

*I would like to give my sincere thanks to **Mr TMJA Cooray**, the former coordinator of the degree programme, for his kind support and guidance provided throughout the last few years. With his support, guidance, and cooperation, I was able to fully concentrate on completing my thesis.*

I would like to record my appreciation to all my fellow students and friends in UOM. They have always supported me with encouragement to continue with my study. Thank you again for helping me.

I would like to pay my gratitude to the head, and the staff members of the Department of Accountancy, WUSL, for their support, insights, and motivation have given.

I am eternally grateful for this kindness of my family members, including my beloved parents, for their kind encouragement and support are given in succeeding this milestone.

Special thanks should go to Chathuranga, Pradeep, Isuru, Udith, and Kasun who contributed in numerous ways for me to complete this thesis.
