

Improving Transient Stability of an Islanded Microgrid Using PV Based Virtual Synchronous Machines

W.P.M. NISITHA U. PADMAWANSA

178522F

Thesis submitted in partial fulfilment of the requirement for the
degree of Master of Science

Department of Electrical Engineering

University of Moratuwa

Sri Lanka

January 2020

Declaration of The Candidate and Supervisor

I declare that this is my own work and this thesis does not incorporate without acknowledgement any material previously submitted for a Degree or Diploma in any other University or institute of higher learning and to the best of my knowledge and person except where the acknowledgement is made in the text.

Also, I hereby grant to University of Moratuwa the non-exclusive right to reproduce and distribute my thesis, in whole or in part in print, electronic or other medium. I retain the right to use this content in whole or part in future works (such as articles or books).

Nisitha Padmawansa

Date

The above candidate has carried out research for the Masters thesis under my supervision.

Signature of the supervisor

Date

(Dr. Lidula N. Widanagama Arachchige)

Abstract

Renewable energy integrations are increasing rapidly in this decade. Lot of countries like Denmark, German and United Kingdom have already set their own targets for renewable energy instigation in their future grids. When considering renewable energy power generation (Solar and wind), most of the time, inverters are used for grid integration. Conventional power generation is based on synchronous generators (Coal, Nuclear, Hydro). Due to the large integration of renewable power plants, power system is moving to a synchronous generator dominant power system to inverter dominant power system. This makes a significant impact on the system inertia response. Inertia is given from the rotating mass of the conventional generators but in inverters, as there are no any rotating masses, inverters cannot contribute to system inertia. Lack of inertia makes poor inertia response. When there is lack of inertia, system's ability to maintain stability under disturbances will be weakened, which would limit the integration of renewable sources. Microgrids, particularly PV-Hydro based Microgrids would be seriously affected from this issue.

This research is carried out to provide a solution for the aforementioned issue by emulating inertia through inverters. Since there are no any actual rotating parts, when emulating inertia through inverters, dynamic inertia response can be implemented compared to the static inertia in synchronous generators.

Due to disturbances in the system, the operation of solar PVs will also be affected. Because of that an energy management system is introduced to support virtual synchronous generator and to keep the PV plant operation at its maximum power point without interruption. The proposed controllers are verified through simulated PV-Hydro microgrid. Simulations are carried out using PSCAD.

Acknowledgements

Foremost, I would like to express my sincerer gratitude to my advisor Dr. Lidula N. Widanagama Arachchige for the continuous support for my MSc research. I am extremely thankful to her for providing such a nice support and guidance, although she had busy schedule.

I am grateful to all the lecturers of Electrical Engineering Department at University of Moratuwa for the guidance provided by them to success of this research, through their valuable comments.

I would also like to acknowledge Dr. Dharshana Muthumuni for give the opportunity to use PSCAD freely.

I would like to thankful for my colleagues and friends who have help and encourage throughout this research.

Finally, I must express my very profound gratitude to my family: my parents, brother and Dilini whose love and guidance are with me in whatever I pursue.

Table of contents

Declaration of The Candidate and Supervisor	i
Abstract.....	ii
Acknowledgements	iii
Table of contents.....	iv
List of Figures	viii
Abbreviations	x
Chapter 1: Introduction	1
1.1 Background.....	1
1.2 Problem Statement	2
1.3 Motivation	2
1.4 Objectives	2
1.5 Thesis Outline	2
Chapter 2: Literature review	3
2.1 Frequency control in power systems	3
2.1.1 Inertia response	3
2.1.2 Primary response	3
2.1.3 Secondary response	3
2.1.4 Tertiary response	4
