Abstract

In a developing country like Sri Lanka, it is very important to develop infrastructure facilities to provide facilities to the investors. In this context special emphasis should be drawn towards the road development sector since highway road projects play a major role in infrastructure development.

In the construction of highways, number of water streams have to be crossed and the surface runoffs along the highways are also to be properly directed.

In Irrigation projects also the water conveyors are to be provided from the water sources to the desired crop fields. For these requirements in road sector as well as in irrigation schemes, concrete pipes are widely used as a cheap option.

In highway projects, for the storm water lines, high strength concrete pipes are used. Those pipes should be able to carry heavy traffic loads as well as embankment loads while providing non interrupted water drainage path. Mainly in urban areas with limited space, high strength concrete pipes are being widely used as water paths diverting surface runoff to the drainage canals. As an example, in the recent past within Colombo urban area, major road development projects were carried out. The surface runoff and water from either side of road had to be diverted to the open channels through concrete pipes. Therefore it is very important to provide durable and strong concrete pipes.

When the pipe manufacturing industry is considered, it is found that manufacturing process is not developed systematically for concrete pipe production. Still the process in Sri Lanka is in primitive level compared to the techniques used in other countries. There are no proper manufacturing details available for the production of structurally sound concrete pipes in Sri Lanka.

On the other hand, from the results of previously carried out pipe tests, it was clearly seen that most of the large diameter pipes (specially when diameters are more than 600mm) were failed to satisfy the strength requirements

specified in (SLS 452:1979) Sri Lankan specification for NP3 concrete pipes with respect to three edge bearing test. Large number of concrete pipes were rejected due to the repetitive strength failures. Lot of material and time had been wasted due to strength failure and caused the delays in construction projects.

Therefore the investigation of influential parameters on the strength of concrete pipes is necessary for the industry to improve pipe manufacturing process to produce strong concrete pipes economically.

In this regard, initially the literature review and site survey were carried out and secondly the analysis of concrete pipes was carried out using PROKON software. Based on the results of the numerical analysis for the large diameter concrete pipes the key parameters to the strength of pipes were investigated. The effects of pipe wall thickness, amount of reinforcement as well as the influence of concrete grades were identified as key factors to the strength of concrete pipes.

From the results it was found that the use of higher concrete grade does not make substantial effect on the strength of concrete pipes. The circumferential reinforcement and the pipe wall thickness are the main parameters which influence the strength of concrete pipes.

Further, the reinforcement requirement for most commonly used large diameter pipes with various pipe wall thicknesses were calculated and presented in this report.

Acknowledgements

First, I wish to express my gratitude and thanks to the Vice Chancellor of the University. Also I wish to thank the Dean, Faculty of Engineering and Head of the Department of Civil Engineering of the University of Moratuwa.

Next, I would like to express my sincere gratitude to the staff of the University of Moratuwa who taught me Engineering since the day I entered as an undergraduate to this excellent institution. Then I wish to express my thanks to all the staff of the structural Engineering Division of Department of Civil Engineering at the University of Moratuwa for teaching me throughout the Post Graduate course fruitfully.

I must thank Kumagai Gumi Co Ltd, my working place for providing the opportunity to follow the Post Graduate course in Structural Engineering design.

It is my duty to give my special thanks to Mrs. D Nanayakkara, Senior Lecturer at the Dept. of Civil Engineering who guided and encouraged me throughout this research work. As the course coordinator of the Post.Graduate.Diploma course, her devotion to conduct the P.G. course is also acknowledged.

I would like to thank Dr. (Mrs.) M.T.P.Hettiarachchi, the research coordinator who monitored the progress of the research work timely and coordinated effectively.

Also I must thankful to the concrete pipe manufacturers, International Construction Consortium, Lankan Hume Pipes, Industrial Hume pipes, Dias Concrete Works and Engineering Laboratory Services for providing all necessary information regarding the pipe manufacturing process and the problem encountered in pipe manufacturing industry.

DECLARATION

I, Kulasiri Kuruppu Nanayakkara, hereby declare that the content of this thesis is the original work carried out by me. Whenever others' work is included in this thesis, it is appropriately acknowledged as a reference.

2.1.4.1 AS 3725-1989.....	17
2.1.4.2. AS4058 -1992.....	17

Chapter 3- Field Survey

3.1 General.....	20
3.2 Pipe casting Methods.....	20
3.2.1 Spun type pipe casting method.....	20
3.2.2 Vertical casting method.....	23
3.3 Testing of pipes for strength.....	26

Chapter 4 – Analysis of pipe strength data

4.1 General.....	29
4.2 Details and results of analysed pipe strength data.....	29

Chapter 5 – Analysis of concrete pipes and Results

5.1 General.....	32
5.2 Selection of software.....	32
5.3 Preparation of model and analysis.....	32
5.3.1 Preparation of model using beam element	33
5.3.1.1 Analysis of Concrete pipe using beam element.....	35
5.3.1.1.1 Analysis of concrete pipe for Ultimate loads.....	35
5.3.1.1.2 Analysis of concrete pipe for Proof loads.....	36
5.3.2 Preparation of model with 2D plain stress elements.....	40

5.3.2.1 Analysis of concrete pipe using 2D plain stress element for Ultimate loads.....	40
---	----

Chapter 6 – Design of concrete pipes

6.1 General.....	46
6.2 Design Calculations based on the results of beam element method.....	46
6.2.1 Calculation for Ultimate loads.....	46
6.2.2 Calculation for Proof loads.....	47
6.3 Design calculations based on 2D plain stress element method.....	51
6.3.1 Design for ultimate loads.....	51
6.4 Comparison of design calculations based on beam element method and 2D plain stress element method	54
6.5 Results of design calculations.....	54
6.6 Cost comparison of concrete pipes with different pipe wall thicknesses...	56

Chapter 7 - Conclusion and Recommendation

7.1 Conclusion.....	61
7.2 Recommendations.....	62
