

UNMANNED AERIAL VEHICLE DESIGN FOR IMPROVED MANUVARABILITY

Thesis submitted in partial fulfillment of the requirements for the degree of Master of Philosophy

Department of Electronic & Telecommunication Engineering

University of Moratuwa Sri Lanka

April 2011

Declaration

I, W. T. M. S. Tennakoon, declare that this is my own work and this thesis does not incorporate without acknowledgement any materials submitted for a Degree or Diploma in any other University or institute or higher leading and to the best of my knowledge and belief it does not contain any material previously published or written by another person except where the acknowledgement is made in the text.

Also, I hereby grant to University of Moratuwa the non-exclusive right to reproduce and distribution, in whole or part in print, electronic or other medium. I retain the right to use this content in whole or part in future works (such as article or books).

The above candidate has carried our research for the MPhil Dissertation under my supervision.

Dr. S. R. Munasinghe Senior Lecturer Dept. of Electronic & Telecommunication Engineering Faculty of Engineering University of Moratuwa (Signature of the supervisor) Date :

Abstract

This thesis presents a non linear automatic unmanned aerial vehicle (UAV) control simulation demonstrating high maneuverability and precise tracking performance on a simulation testbed. High maneuverability leads to satisfy the requirements of future missions. Much of the recent research on UAVs focus on multiple UAV coordination planning and path planning and the high maneuverability controllers are given minimal attention. Major requirements for the high maneuverability are better dynamic stability with fast response and low coupling between control commands. This research work is presented that way to modify classical system with merging with modern concepts to achieve high maneuverability. State feedback method, decoupling techniques and duel loop method are used for autopilot controller implementation. Simulation results confirm the validity of proposed techniques, which have been used to enhance autopilot capabilities with less complexity. Non liner effects due to normal mission profile were also measured.

Acknowledgments

During the past 3 years, I had the amazing opportunity of completing this project as my Master of Philosophy Degree. This research project would not have been possible without the support, encouragement, motivation, expertise and advice given to me in abundance by so many individuals. I would like to take this opportunity to sincerely thank everyone who contributed in so many ways, among them, the following people played a big part in making this project a success.

First and foremost, special thank goes to the project supervisors late Dr. D.A.I. Munindradasa and Dr. S.R. Munasinghe for all the motivation, inspiration, guidance and support given to me during the stages of the project work. I also thank to Dr. A. Pasqual, post graduate coordinator, Prof. L. Udawatta progress review committee chairmen, Dr. E.C. Kulasekara, Mr. K. Samarasinghe, for immense encouragement and support given throughout the project period. I would like to thank my B.Sc. Eng final year project group members who worked with me in the earlier stage of this work.

Finally my respectful thanks go to the Center for Reseach and Development (CRD) for facilitating the funding requirements, former Air Force Commander Air Marshal R. Gunathilake for providing necessary facilities and accommodation at Rathmalana Air Force Base, staff of the SLAF 111- Vavuniya and 112-Anuradhapura UAV squadrons, the Air Force Group Captain J. Amarasena the CRD Coordinator for providing their help, expertise and ideas. My sincere thank also goes to Air Commodore R. Pathirage, Sqn Ldr T. Wanigasekara, Sqn Ldr E. Geeganage, Sqn Ldr M. Krishantha, SLAF Rathmalana Base, for helping me during the initial stages of the project and also special thank goes to Wing Cdr N. Jayasinghe, Wing Cdr W. Senarathne, EP Wing Cdr M. Balasuriya and IP Sqn Ldr Senarath who shared their expertise and helped me in various ways.

Without their help this work would have never made its way to reality. I also thank all other people who helped me in this work but were not mentioned by name.

Nomenclature

A, B, C	State, Control and output matrix of the linearized aircraft model
g	Acceleration due to gravity in ms^{-2}
K	State feedback gain
p	Perturbation in roll rate from trim value in radians/sec
q	Perturbation in pitch rate from trim value in radians/sec
r	Perturbation in yaw rate from trim value in radians/sec
u	Perturbation in speed along axis in meters/sec
v	Perturbation in speed along axis in meters/sec
w	Perturbation in speed along axis in meters/sec
V	Velocity vector of the aircraft Moratuwa, Sri Lanka.
x	State vector of of the linerized aircraft model
F	Total force vector
M	Total momentum vector
Ι	Total inertia
h	Height
ω	Propeller rpm
α	Angle of attack
α_T	Trim angle of attack
eta	Slide slip
β_T	Trim slide slip
ϕ	Roll angle
ϕ_T	Trim roll angle
heta	Pitch angle
$ heta_T$	Trim pitch angle
$ heta_d$	Pitch demand
δ_a	Deflection of aileron
δ_{aT}	Trim deflection of aileron
δ_e	Deflection of elevator

- δ_{aT} Trim deflection of elevator
- δ_r Deflection of rudder
- δ_{rT} Trim deflection of rudder
- α_n Throttle value
- δ_{nT} Trim throttle value
- ψ Actual heading
- ψ_d Heading demand
- ω_n Natural frequency
- ζ Damping factor
- $\{E\}$ Earth fixed reference frame
- $\{A\}$ Airplane fixed reference frame
- $\{B\}$ Body fixed reference frame
