

## CONCLUSION

A good quality control system is a necessary component in the production of good garments. Quality means money. Therefore a factory must be able to produce an acceptable quality level as agreed before hand between the manufacturer and the buyer. With a random quality checking procedure well organised system based on the following suggestions would produce better quality products, because quality control has been recognised universally as a scientific method of improving quality.

## SUGGESTIONS

University of Moratuwa, Sri Lanka.

Electronic Theses & Dissertations

- 1) Quality of the imported yarn should be checked.
- 2) Trials must be carried out before introducing new yarn batches.
- 3) The number of samples taken for trials should be based on statistical principles.
- 4) Statistical quality control systems must be introduced.
- 5) It is desirable for the quality controller to have a knowledge of statistical quality control methods.
- 6) Various section heads should be given training on the use of modern technological methods and equipment.

- 7) The communication system between the various department should be effective so as to detect and correct the faults as and when they occur on the line.
- 8) The boarding section should be rearranged after a thorough work-study.
- 9) The person in charge of Production should have a sound knowledge on all the matters concerned with the departments under him.
- 10) An investigation should be carried out to estimate the optimum winding tension for maximum production efficiency in the knitting section.

University of Moratuwa, Sri Lanka.  
Electronic Theses & Dissertations  
[www.lib.mrt.ac.lk](http://www.lib.mrt.ac.lk)

- 11) An Investigation should be carried out to estimate shrinkage percentage. It would help calculate raw measurements, and hence reduce waste in cutting.
- 12) Length variation is a typical problem in the case of plane knitted articles (Fig 24,26,27). Statistical machine adjusting method would be a help to reduced fault percentage from exceeding 2% of total production(Fig 28).
- 13) Twist factor should be changed for acrylic yarn which is used for 1x1 rib.
