

**110V UNIVERSAL BATTERY CHARGING PANEL
USING PIC MICROCONTROLLER**

A dissertation submitted to the
Department of Electrical Engineering, University of Moratuwa
in partial fulfillment of the requirements for the
degree of Master of Science

by

SWARNA KUMARA VIJITHANANDA

Supervised by: Dr. J.P Karunadasa

**Department of Electrical Engineering
University of Moratuwa, Sri Lanka**

December 2006

DECLARATION

The work submitted in this dissertation is the result of my own investigation, except where otherwise stated.

It has not already been accepted for any degree, and is also not being concurrently submitted for any other degree.

.....

S.K Vijithananda

Date: 11 | 01 | 2007

We/I endorse the declaration by the candidate.

CONTENTS

Declaration	I
Abstract	IV
Acknowledgement	VI
List of Figures	VII
List of Tables	IX

CHAPTER 1

1.00 Introduction	1
1.10 Requirement of the Project.....	1
1.20 Project Benefits.....	1
1.30 Technical Concept & Techniques.....	2
1.40 Project Tools & Materials.....	2

CHAPTER 2

2.00 Structure of the Project	12
2.10 Hardware Circuitry.....	13
2.11 Design of DC-DC Converter.....	15
2.12 Testing Circuit with 555 Timer.....	21
2.13 Converter Switching Amplifier Circuits.....	26
2.14 Overcurrent & Over/Under Voltage Circuits.....	30
2.20 Software Programming.....	34
2.21 Introduction to PIC (16F876A) Microcontroller.....	34
2.22 Analog to Digital Converter (A/D) Module.....	37
2.23 Operation in PWM Mode.....	45
2.24 Assembly Programs for A/D Conversion.....	49
& PWM operation	
2.24 (i) A/D Conversion.....	49
2.24 (ii) PWM Operation	49

CHAPTER 3

3.00 Results and Practical Observation	55
3.10 Waveforms of the DC-DC Converter	55
3.20 Voltage variation of the Panel Output	60
3.30 Project Photos	64

CHAPTER 4

4.00 Practical Limitations Challenges & Difficulties	69
4.10 Technical limitations & Challenges	69
4.20 Financial Difficulties	69

CHAPTER 5

5.00 Conclusion	71
5.10 Conclusion and Remarks	71
5.20 Recommendation for Future Developments	71

Abstract

Conventional power electronics and electronic control circuits have been replaced by the intervention of the microprocessors/microcontrollers in modern industrial applications. This is mainly because with their applications the whole system becomes more and more compact while enhancing the durability. On the other hand even with the more robust applications, more accurate & fine operation could be achieved by using such modern programming devices.

This project was originally based on an actual requirement of designing a 110V battery charging panel (to energize the batteries in spring charge type breakers) for the electrical engineering division of the Jaya Container Terminal (J.C.T) of the Sri Lanka Ports Authority. But this technique would not only be used to charge batteries of spring charge breakers, but also batteries widely used in VHF communication hand-held sets, explosive detectors, emergency lamps, etc...

Rechargeable batteries are vital to portable electronic equipment such as laptop computers and cell phones. Fast charging circuits must be carefully designed and are highly dependent on the particular battery's chemistry. The most popular types of rechargeable batteries in use today are the Sealed-Lead-Acid (SLA), Nickel-Cadmium (NiCd), Nickel-Metal-Hydride (NiMH), and Lithium-Ion (Li-Ion). Li-Ion is fast becoming the chemistry of choice for many portable applications because it offers a high capacity-to-size (weight) ratio and a low self-discharge characteristic.

Depending on the battery chemistry, the charging characteristics of a battery differ to each other. In this project, simply what I have done is allow the particular battery to follow its charging characteristic curve when they were not found in conventional charging techniques. The charging process is controlled by the software program microcontroller (PIC16F876). Since the battery chemistries are different for different types of batteries, several sets of programs would have to be written to the controller for each battery given by the manufacturer.

There are some theoretical design calculations included for designing of power electronics modules. (DC-DC converter, square pulse generator, single rail power & dual rail power supplies,etc...) Calculations have been done based on highly theoretical facts. . Therefore some practical observations are tends to differ from the theoretical approach. Most of the theories studied in the power electronic lessons of my M.Sc post graduate were widely used in doing above mentioned designs.

At the beginning the actual target was to built a battery charging panel of 110V,but due to some limitations of purchasing of high capacity transformer which suit to this application, the project was limited to 40V panel only. But the concept, approach & the guide line would be more or less same for the more advanced systems also.

Acknowledgement

Thanks are due first to my supervisor, Dr. J.P Karunadasa, for his great insight, perspectives, guidance and of humor. My sincere thanks go to the JCT Electrical engineering staff of J.C.T (Jaya Container Terminal) of Sri Lanka Ports Authority for helping in various ways to clarify things related to my academic works in time with excellent corporation and guidance. Sincere gratitude is also extended to the people who serve in the Department of Electrical Engineering office.

I extend sincere gratitude to my superiors, Mr. A.D.T Gunasekara (Chief Electrical Engineer of Sri Lanka Ports Authority) who made me to be released from my duties to success this project & Mr.H.A.N.S Fernando (Deputy Chief Electrical Engineer) who suggested this project concept for this thesis.

Lastly, I should thank many individuals, friends and colleagues who have not been mentioned here personally in making this educational process success. May be I could not have made it without your supports.
